

(a) two paths from the upstream transform to suppression, and the one Mode S cuts

Mode S cuts this path: every adversary pinned at $c = 1.0$, adversarial coefficient share $\equiv 0.266667$

fraction of rounds / ASR

(b) Mode S, Krum: the statistic moves, admission does not

dose $\rho = e^{2\kappa}$ (benign dispersion; adversary pinned at $c = 1$)
